NEE LEVEL OF RELIABILITY

1. Reliability (Mean Time Between Failures)

- Mean Time Between Failures (MTBF) is a measure of the reliability of a system. It is the average time between failures of a system.
- MTBF is calculated by dividing the total operating time of a system by the number of failures that occur during that time.
- MTBF is a key performance indicator (KPI) for reliability. It is used to compare the reliability of different systems and to identify areas for improvement.
- MTBF is also used to estimate the cost of ownership (COO) of a system. A system with a higher MTBF will have a lower COO because it will require less maintenance and have a longer lifespan.
- MTBF is a measure of the reliability of a system. It is the average time between failures of a system.

Reliability Test

Heavy Duty Rubber Tracks

Heavy Duty Undercarriage

Heavy Duty Hydraulic Cylinders
It's important to use the right hydraulic cylinder for the job. The right cylinder will provide the right amount of force and speed.

Heavy Duty Blower

Heavy Duty Motor

1. The first step in the process is to identify the problem or goal. This involves understanding the current situation and what you want to achieve.

2. Next, you need to gather information. This could involve research, talking to experts, or looking at data. The more you know, the better you can plan.

3. Once you have gathered information, you can start to develop a plan. This should include a clear goal, a timeline, and a list of tasks. It's important to be realistic and to have a backup plan.

4. After you have a plan, you need to put it into action. This involves doing the tasks you have identified and keeping track of progress.

5. Finally, you need to evaluate the results. This involves looking at what you have achieved and what you have learned. It's important to be honest and to learn from your mistakes.

NEW LEVEL OF FUEL EFFICIENCY

THE NEW FULL-POWER HYDRAULIC SYSTEMS OFFER A NEW LEVEL OF FUEL EFFICIENCY AND PERFORMANCE.

NEW LEVEL OF FUEL EFFICIENCY

HIGHER LEVEL OF PRODUCTIVITY

The 4800 is a high-capacity machine. In 4800's 2000-hr. production cycle, the 4800 can dig 1000 cu yd of earth in 1000 hrs. The 4800's 2000-hr. production cycle is 100% more productive than the 3800's 1000-hr. production cycle.

The 4800's 2000-hr. production cycle is 100% more productive than the 3800's 1000-hr. production cycle. The 4800's 2000-hr. production cycle is 100% more productive than the 3800's 1000-hr. production cycle.

Productivity increases from 100% to 200%.

EXCELLENT DIGGING

Model	Capacity	Production Cycle
4800	1000 cu yd	2000 hrs
3800	500 cu yd	1000 hrs
2800	250 cu yd	500 hrs

- The 360° turn allows all sides effectively to work
- Greater maneuverability in tight spaces
- Increased productivity for the operator
- Increased safety for the operator
- Increased visibility for the operator
- Increased fuel efficiency
- Increased maintenance-free operation
- Increased operator comfort
- Increased operator safety
- Increased operator productivity

1. The first step in the process of creating a new product is to identify a market need. This can be done through market research, which involves gathering information about the target market and its needs.

2. Once a market need has been identified, the next step is to develop a concept for the product. This involves creating a detailed description of the product and its features.

3. The third step is to create a prototype of the product. This is a physical model of the product that can be used to test its design and functionality.

4. The fourth step is to conduct a feasibility study. This involves evaluating the product's potential for success in the market, taking into account factors such as cost, competition, and demand.

5. The fifth step is to develop a business plan. This is a document that outlines the company's strategy for producing and marketing the product, as well as its financial projections.

6. The sixth step is to secure financing. This involves raising the capital needed to produce and market the product, which can be done through a variety of sources, including investors, banks, and crowdfunding.

7. The seventh step is to produce the product. This involves manufacturing the product in a factory or workshop, and then distributing it to retailers or directly to consumers.

8. The eighth step is to market the product. This involves promoting the product through advertising, public relations, and other marketing activities.

9. The ninth step is to evaluate the product's performance. This involves monitoring sales, customer feedback, and other metrics to determine how well the product is performing in the market.

10. The tenth step is to make improvements. This involves identifying areas where the product can be improved and implementing changes to make it better.
